

Welcome to our Compost Station

Decomposition is the process of turning dead material into nutrients that plants use as food.

It's nature's way of recycling!

In our compost bin, bacteria (decomposers) use oxygen and heat to breakdown organic materials.

What you can add to the bin:

- ✓ Grass clippings
- ✓ Dead flowers
- ✓ Vegetable & fruit waste
- ✓ Cardboard
- ✓ Paper
- ✓ Sticks
- ✓ Leaves

Do NOT add to the bin:

- × Diseased plants
- × Perennial weeds
- × Weeds with seed heads
- × Plastic
- × Meat
- × Oil
- × Fat

Finished compost is dark, spongy, and full of nutrients. We spread our compost into our gardens to fertilize the plants, help break-up the soil so that it can retain water, and help the plants grow faster and bigger!

Scan this QR Code to learn more about decomposition.

Enjoy nature's beauty!

Protect it from litter & vandalism!
